

ARTIFICIAL INTELLIGENCE LEADERSHIP AND MANAGEMENT CERTIFICATE

Introduction

Graduate certificates are offered in specialized business areas and are designed to update skillsets or explore a new area of business. Courses are tailored to the working professional with online and evening class options.

The Artificial Intelligence Leadership and Management certificate prepares students to lead organizations through digital transformation by understanding both the strategic potential and organizational challenges of artificial intelligence. Unlike technical AI programs focused on building models, this specialization develops business leaders and managers who can strategically integrate AI into organizations, govern its deployment responsibly, and drive innovation across their enterprises.

Certificate Requirements

The certificate requires students to complete four 3-credit eight-week courses offered either in person or online. Credit from these courses can be applied to a future graduate degree at the CU Denver Business School.
